

Patch-Based Approach to Land-Classification of Sentinel-2 Satellite Imagery

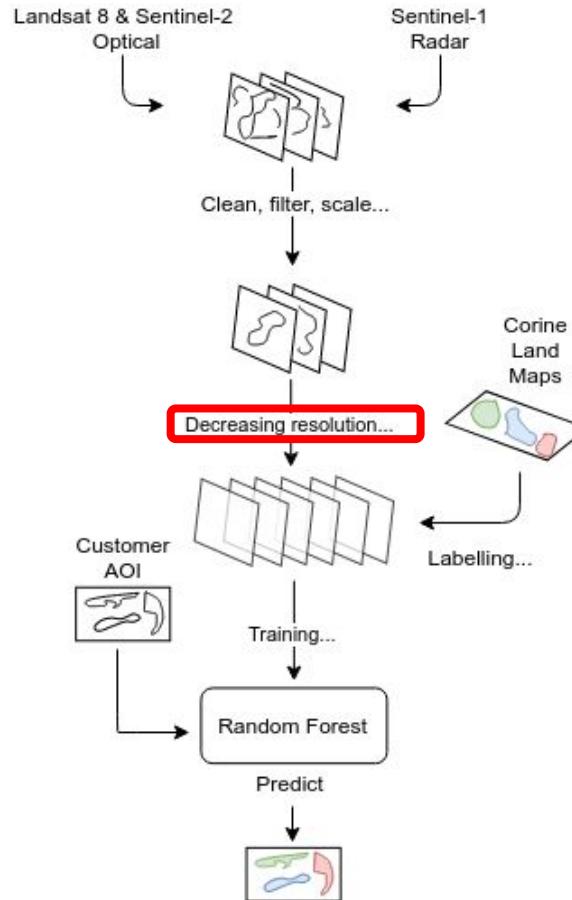

David Smith

Project Outline

- Explore alternative methods to the current GSI land-classification methodology.
- Evaluate these methods over a shared area of interest.
- Assess how useful they could be for GSI.

Current Methodology

- After retrieving imagery, it is downsampled to match CORINE ground-truth.
- 10m resolution degraded to 400m.
- Gives an informative average of local area.
- High risk of information loss.
- 10m resolution imagery has high spatial content over 400m region.

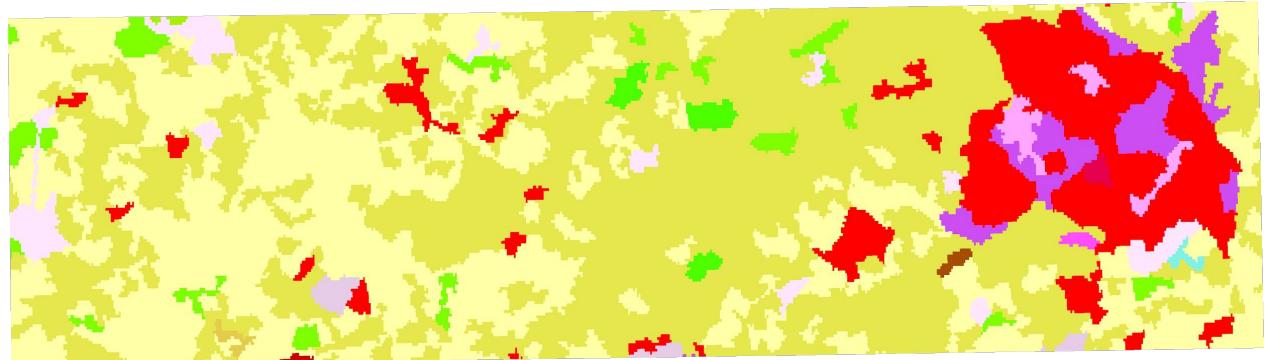

Project Objectives

- This project was exploring alternatives to downsampling.
- Develop methods incorporating the spatial and textural information within image regions, instead of just smoothing the region with an average.
- Test a predictive model trained on the processed image.
- Evaluate the model performance vs the current methodology.

Area of Interest

- Continuous urban fabric
- Discontinuous urban fabric
- Industrial or commercial units
- Road and rail networks and associated land
- Airports
- Dump sites
- Construction sites
- Green urban areas
- Sport and leisure facilities
- Non-irrigated arable land
- Pastures
- Land occupied by agriculture and vegetation
- Broad-leaved forest
- Mixed forest
- Transitional woodland-shrub
- Water bodies

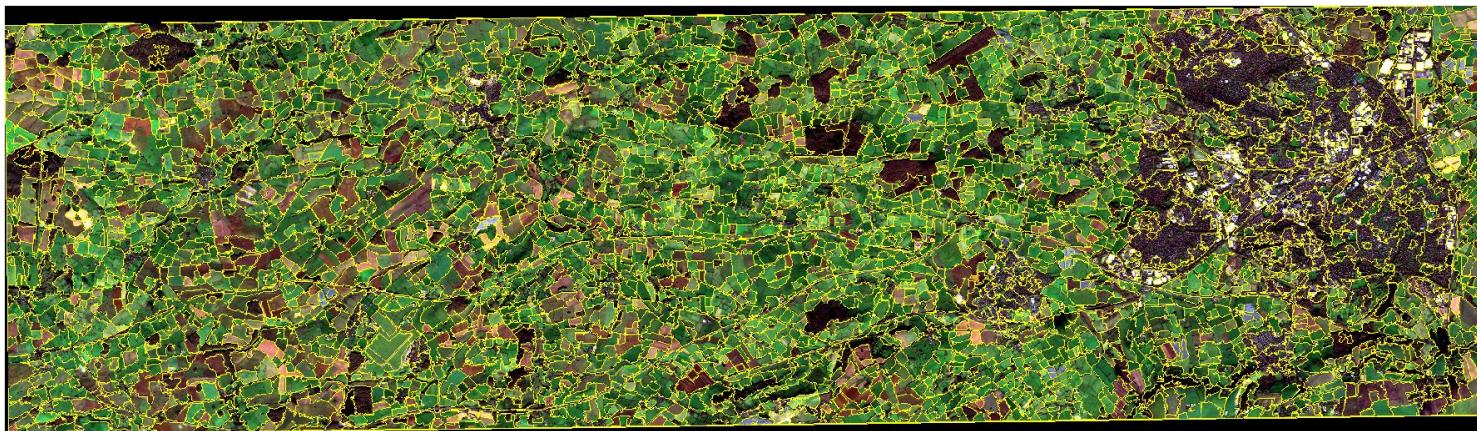

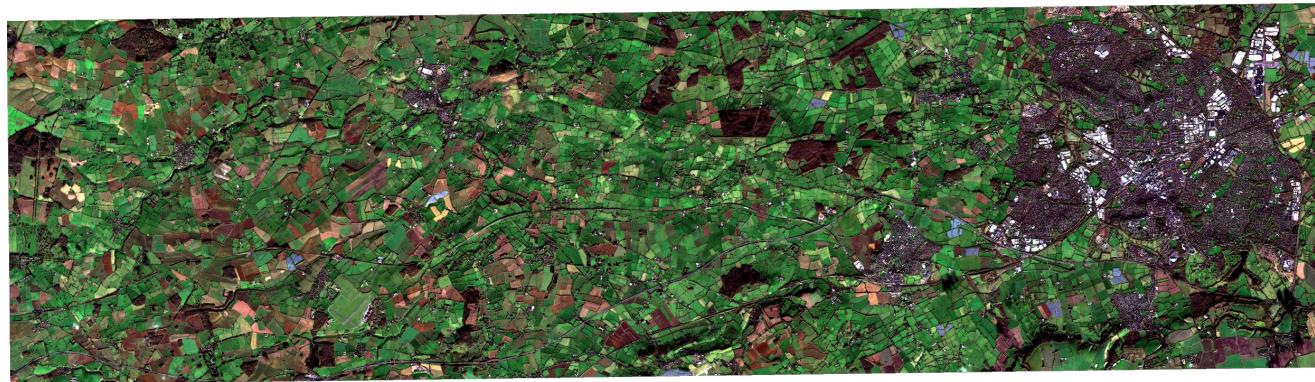

Data Considerations

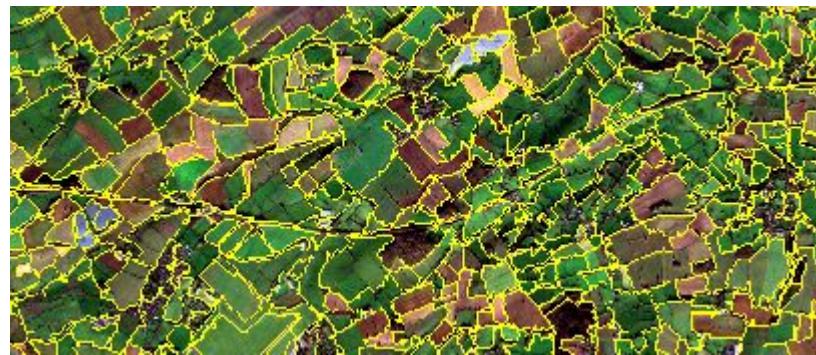

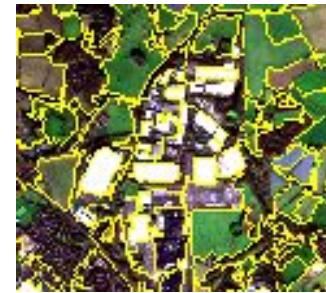

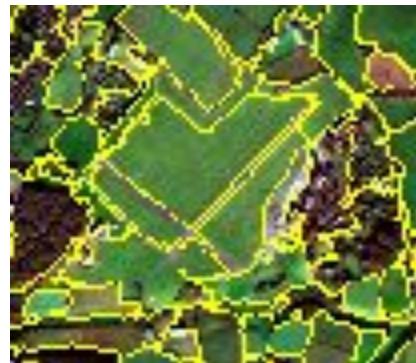

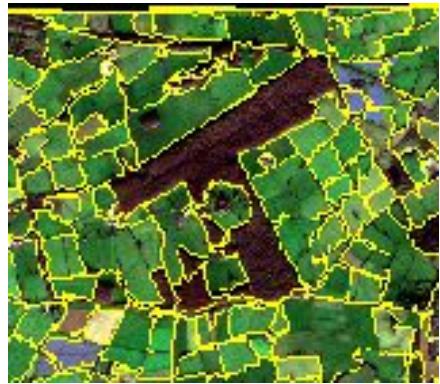

- We were only considering bands 2,3,4 and 8.
- Calculated NDVI index.
- Predicting 17 classes present in the AOI.

Methodologies

Segmentation Method

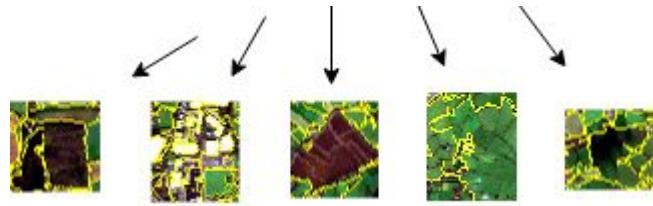

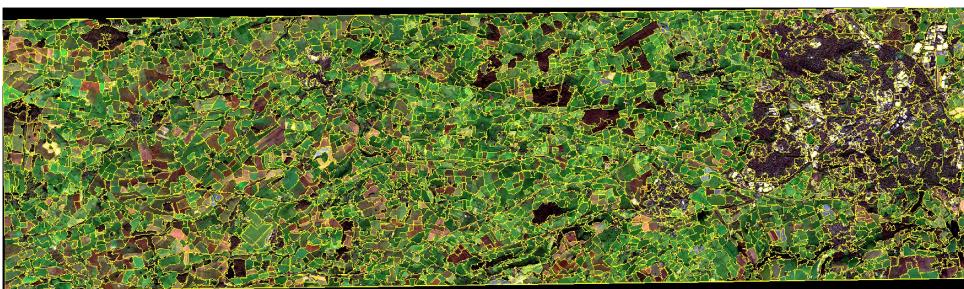

- First step to exploring the texture within the image.
- Take advantage of obvious colour similarities in the AOI.
- Graph-based segmentation.
- Plots each pixel as a connected node on a graph.
- Nodes with strong connections grouped together.

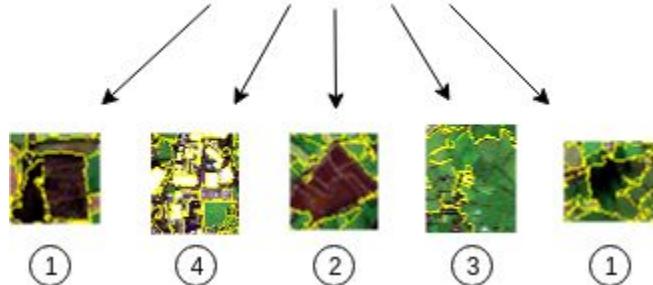

Approach

- Quantify segments based on mean value.
- Create a hierarchy based on these values.
- Apply this information to the pixels in the AOI.

Mean Value?

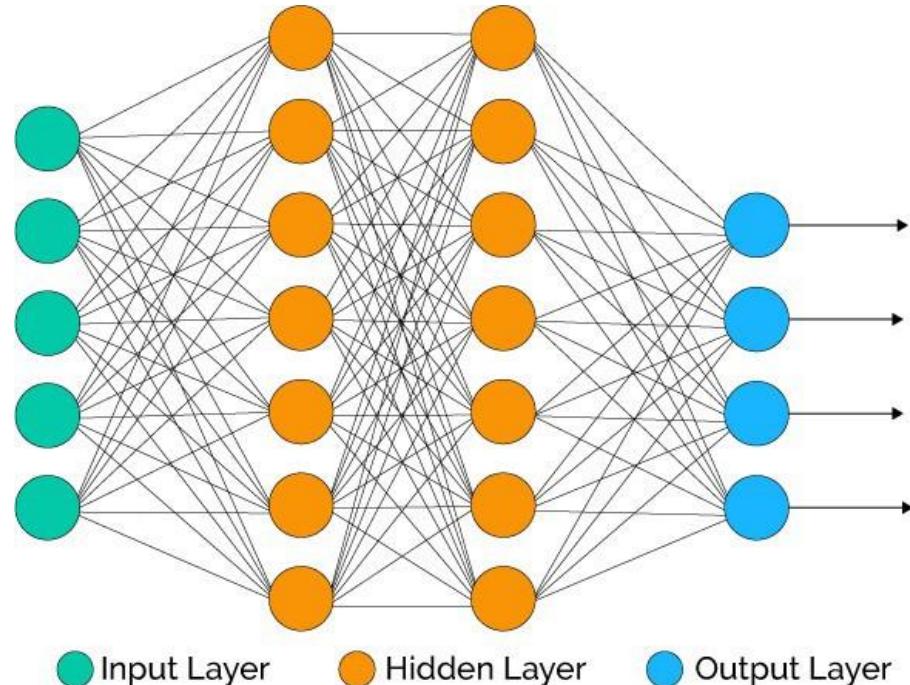

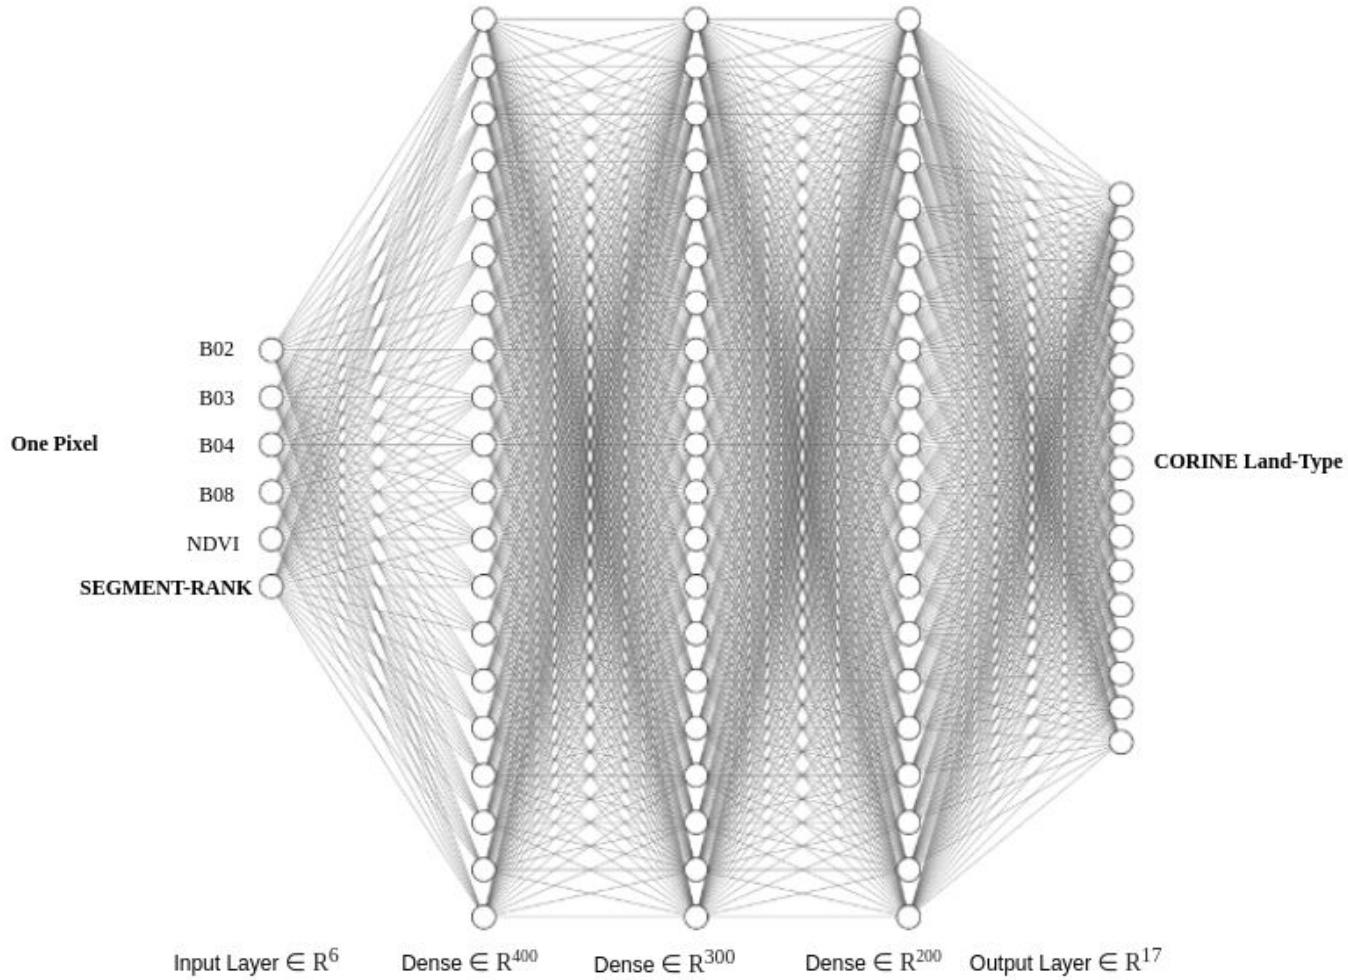

Training

- Randomly extracted single pixels.
- For every pixel, we attached a “segment-rank” variable based on the segment that contained it.
- Training set consisted of a dataframe of pixel band values, NDVI index values, segment-rank values and CORINE labels.
- A single row represented one pixel.

Algorithm Choice

- Deep learning approach
- Neural networks
- Basic architecture:
- Multi-Layer Perceptron (MLP)

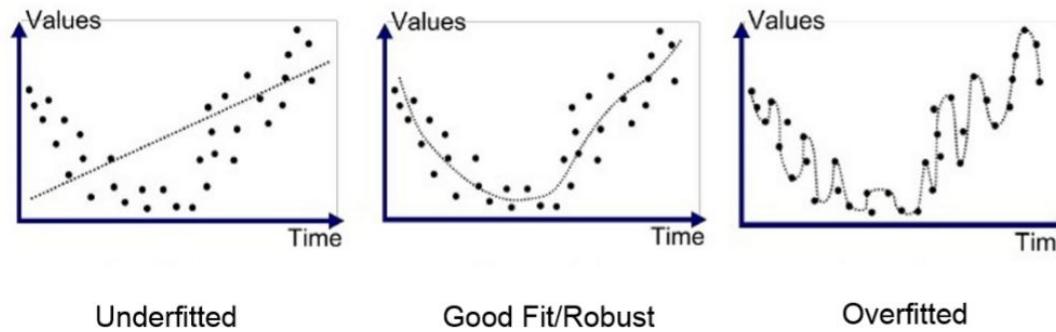

Baseline

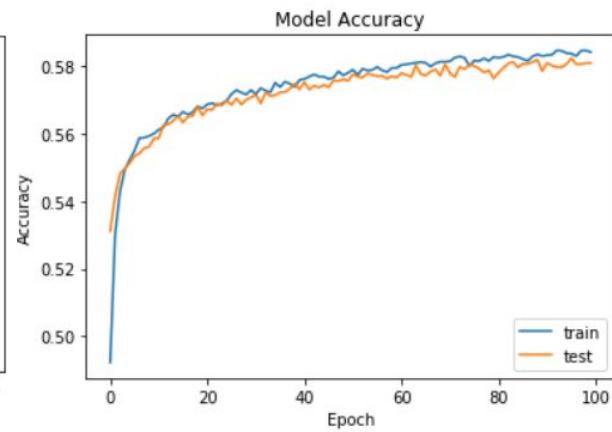

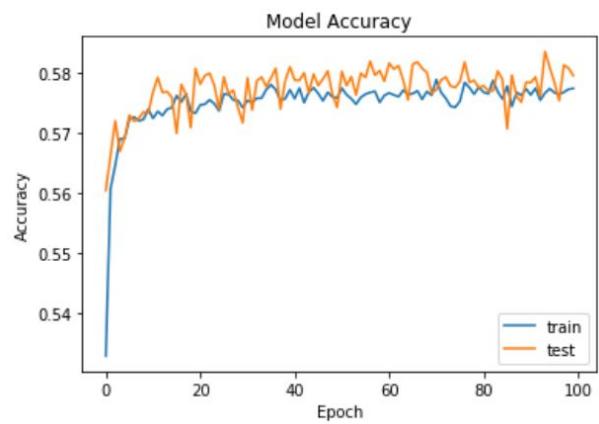

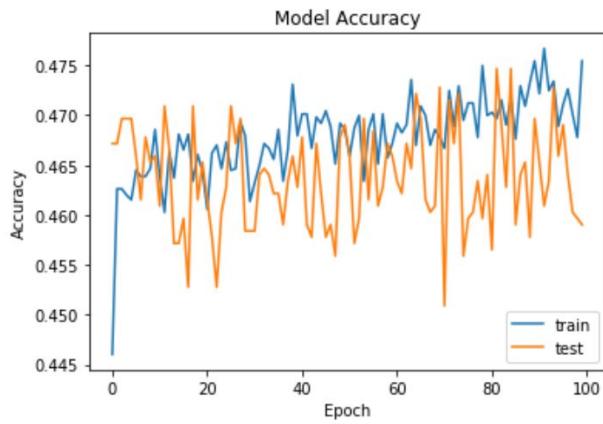

- MLP-Pixel
- Random Forest Regressor
- GSI-RF metrics from AOI test

Training and Validation

- Trained on between 10,000 and 250,000 pixels.
- Tweaked model parameters and architecture.
- Batch-size, learning rate, epochs and regularization.

- 60/20/20 training, validation and testing.

Testing Results

| Classifier | Training Set | Valid Acc (%) | Test Acc (%) |
|----------------------|---------------------|----------------------|---------------------|
| MLP | 10000 | 54.53 | 51.84 |
| | 100000 | 58.5 | 56.19 |
| | 250000 | 59.21 | 58.3 |
| MLP-Pixel | 10000 | 55.64 | 51.75 |
| | 100000 | 56.32 | 55.53 |
| | 250000 | 57.23 | 56.87 |
| Random Forest | 10000 | 24.25 | 21.52 |
| | 100000 | 47.85 | 44.56 |
| | 250000 | 51.36 | 47.52 |

Prediction

- Wanted to recreate the testing conditions from the GSI metrics:

| | Land-Type | Precision | Recall | F1-Score | Support |
|---------------|----------------------------------|------------------|---------------|-----------------|----------------|
| GSI-RF | <i>continuous urban</i> | 0.05 | 0.92 | 0.09 | 4042 |
| | <i>discontinuous urban</i> | 0.42 | 0.52 | 0.46 | 39915 |
| | <i>industrial/commercial</i> | 0.64 | 0.94 | 0.76 | 75389 |
| | <i>road and rail networks</i> | 0.00 | 0.00 | 0.00 | 6459 |
| | <i>airports</i> | 0.21 | 1.00 | 0.35 | 51498 |
| | <i>green urban areas</i> | 0.00 | 0.00 | 0.00 | 0 |
| | <i>sport/leisure facilities</i> | 0.00 | 0.00 | 0.00 | 1540 |
| | <i>non-irrigated arable land</i> | 0.22 | 0.24 | 0.23 | 51650 |
| | <i>pastures</i> | 0.98 | 0.14 | 0.25 | 28582 |
| | <i>broad-leaved forest</i> | 0.39 | 0.45 | 0.42 | 51063 |
| | <i>mixed forest</i> | 0.08 | 0.85 | 0.15 | 78961 |

| | Correct Pred. | Incorrect Pred. | Overall Accuracy |
|---------------|----------------------|------------------------|-------------------------|
| GSI-RF | 145479 | 254521 | 37.00% |

| Land-Type | Precision | Recall | F1-Score | Support |
|--------------------------------|-----------|--------|----------|---------|
| continuous urban fabric | 0.04 | 0.05 | 0.04 | 97 |
| discontinuous urban fabric | 0.63 | 0.40 | 0.49 | 567 |
| industrial or commercial units | 0.59 | 0.32 | 0.41 | 42588 |
| road and rail networks land | 0.01 | 0.00 | 0.00 | 10741 |
| airports | 0.28 | 0.02 | 0.04 | 2000 |
| dump sites | 0.00 | 0.00 | 0.00 | 429 |
| construction sites | 0.00 | 0.00 | 0.00 | 422 |
| green urban areas | 0.10 | 0.00 | 0.00 | 2968 |
| sport and leisure facilities | 0.02 | 0.00 | 0.00 | 9025 |
| non-irrigated arable land | 0.63 | 0.07 | 0.12 | 134621 |
| pastures | 0.73 | 0.75 | 0.74 | 181995 |
| agriculture/vegetation | 0.00 | 0.00 | 0.00 | 514 |
| broad-leaved forest | 0.47 | 0.27 | 0.34 | 51063 |
| mixed forest | 0.57 | 0.29 | 0.38 | 9102 |
| transitional woodland-shrub | 0.00 | 0.00 | 0.00 | 183 |
| water bodies | 0.61 | 0.16 | 0.26 | 454 |

| | Correct Pred. | Incorrect Pred. | Overall Accuracy |
|-----|---------------|-----------------|------------------|
| MLP | 116999 | 283001 | 34.19% |

Analysis

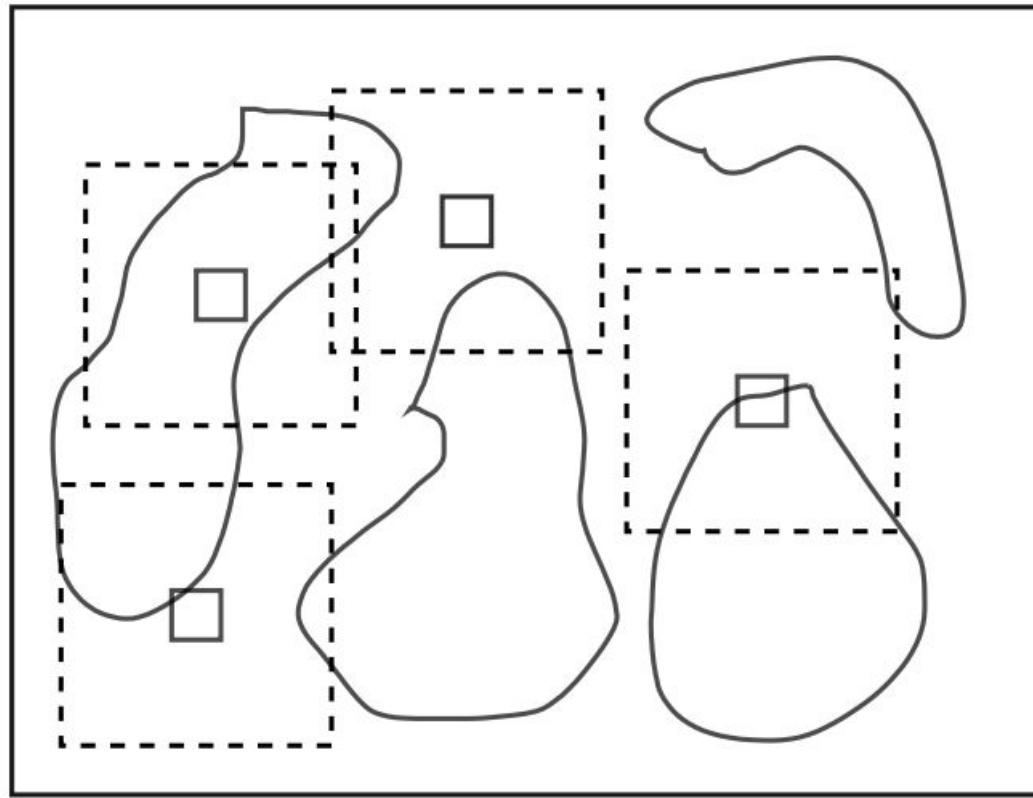

- Varying levels of support between classes.
- Disparity between validation and prediction sets.
- Class-by-class performance.
- Pixel-wise training.

Patch Method

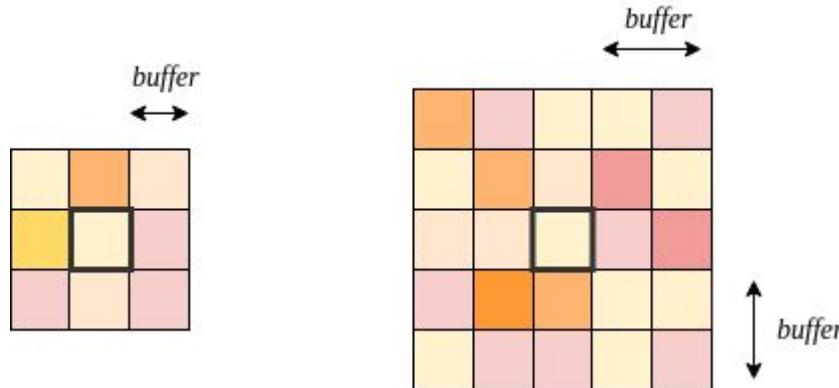

- Training was still constrained to one pixel at a time.
- Wanted to expand our inputs to multiple pixels.
- Gain knowledge of spatial content within an input.
- Could achieve this by extracting clusters, or patches, of pixels.

Approach

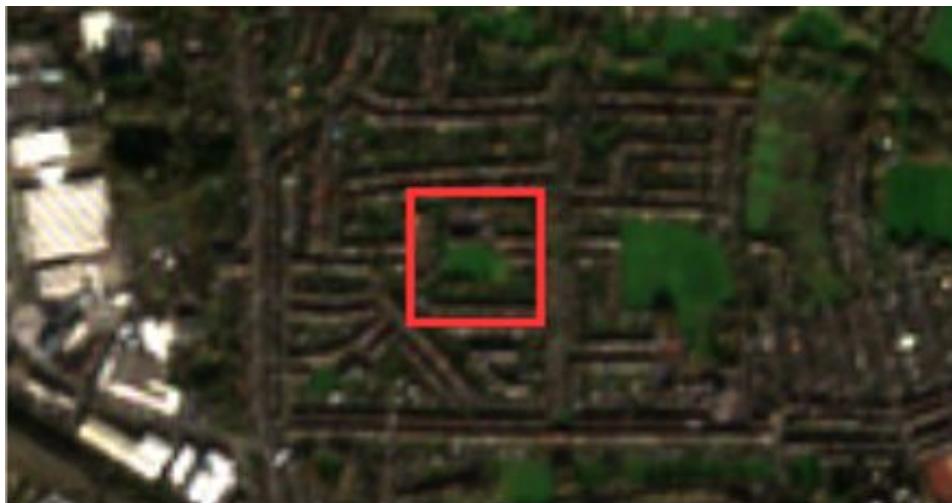

- By randomly sampling pixels in the same way, we could extract a buffer-zone around each, forming a patch of pixels.
- We still wanted to provide predictions for pixels, not patches.
- Predicted the centre pixel label based on its surrounding patch.

- By tweaking the buffer size, we could construct datasets of differently sized patches:

- Patches were three dimensional.
- One layer for each band.
- Dataframe consisted of band value and label for every pixel in patch.

3x3 Patch

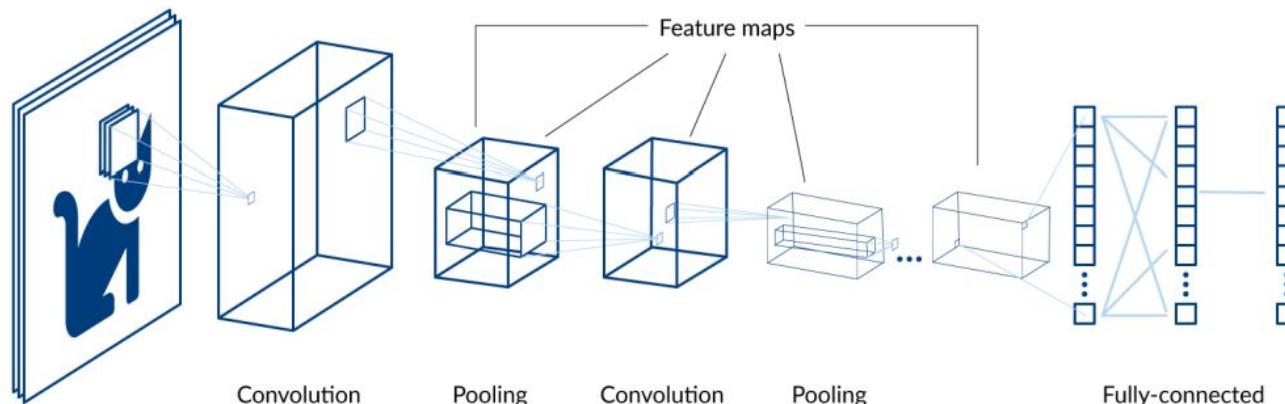

7x7 Patch

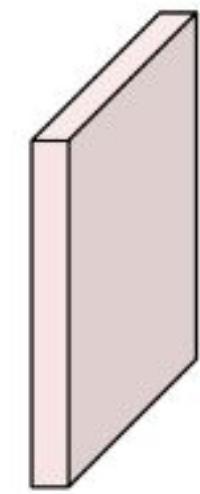

21x21 Patch

Training

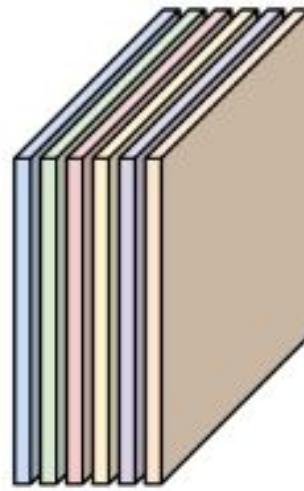

- Extracted between 10,000 and 500,000 patches.
- Learning relationship between the patch values and the centre label.
- This time, one individual represented an image, instead of a pixel.
- Convolutional Neural Networks (CNNs):

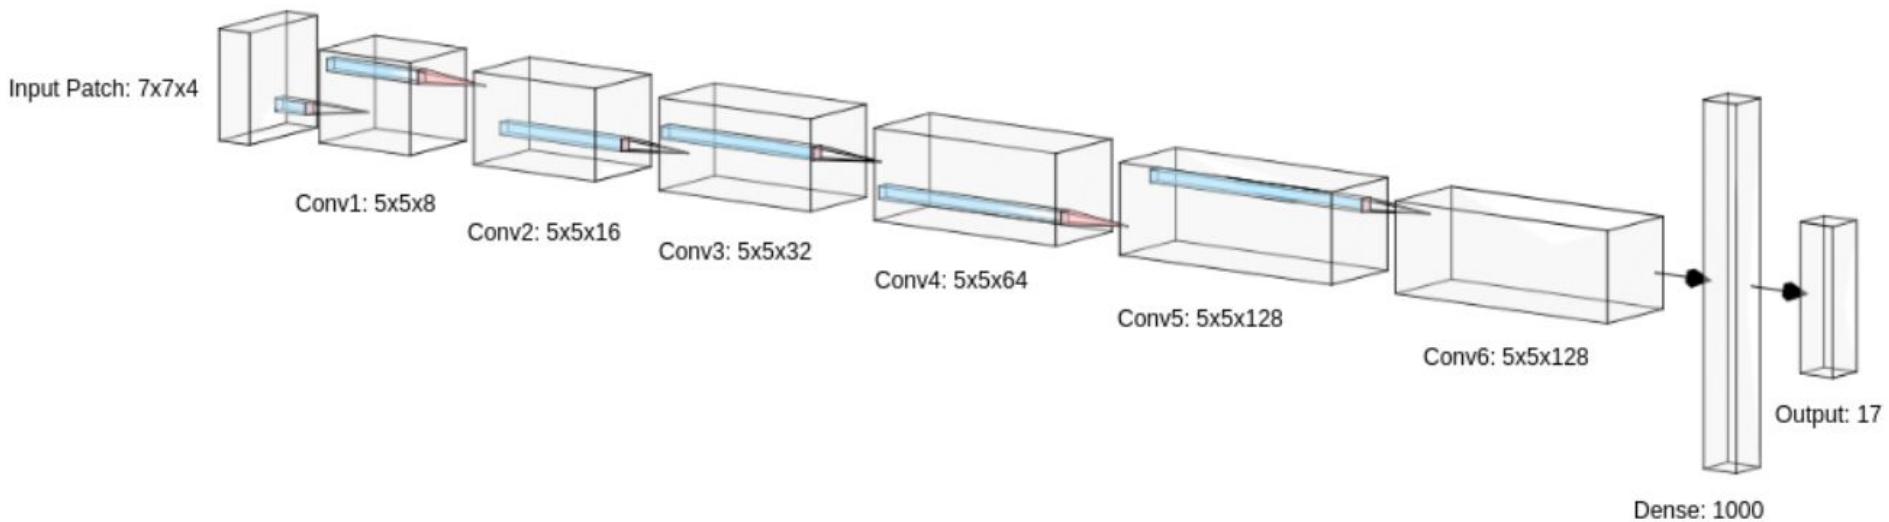

Convolution Layer

activation maps

Model

Training and Validation

- 60/20/20 split.
- Training varied depending patch size:

| Patch Dimensions | Input Values | Validation Acc (%) |
|-------------------------|---------------------|---------------------------|
| 3x3x4 | 36 | 58.32 |
| 5x5x4 | 100 | 59.66 |
| 7x7x4 | 196 | 60.27 |
| 11x11x4 | 484 | 49.06 |
| 21x21x4 | 1764 | 35.78 |
| 61x61x4 | 14884 | 41.32 |

Prediction

- GSI metrics
- Scene-wide prediction

| | Land-Type | Precision | Recall | F1-Score | Support |
|---------------|----------------------------------|------------------|---------------|-----------------|----------------|
| GSI-RF | <i>continuous urban</i> | 0.05 | 0.92 | 0.09 | 4042 |
| | <i>discontinuous urban</i> | 0.42 | 0.52 | 0.46 | 39915 |
| | <i>industrial/commercial</i> | 0.64 | 0.94 | 0.76 | 75389 |
| | <i>road and rail networks</i> | 0.00 | 0.00 | 0.00 | 6459 |
| | <i>airports</i> | 0.21 | 1.00 | 0.35 | 51498 |
| | <i>green urban areas</i> | 0.00 | 0.00 | 0.00 | 0 |
| | <i>sport/leisure facilities</i> | 0.00 | 0.00 | 0.00 | 1540 |
| | <i>non-irrigated arable land</i> | 0.22 | 0.24 | 0.23 | 51650 |
| | <i>pastures</i> | 0.98 | 0.14 | 0.25 | 28582 |
| | <i>broad-leaved forest</i> | 0.39 | 0.45 | 0.42 | 51063 |
| | <i>mixed forest</i> | 0.08 | 0.85 | 0.15 | 78961 |

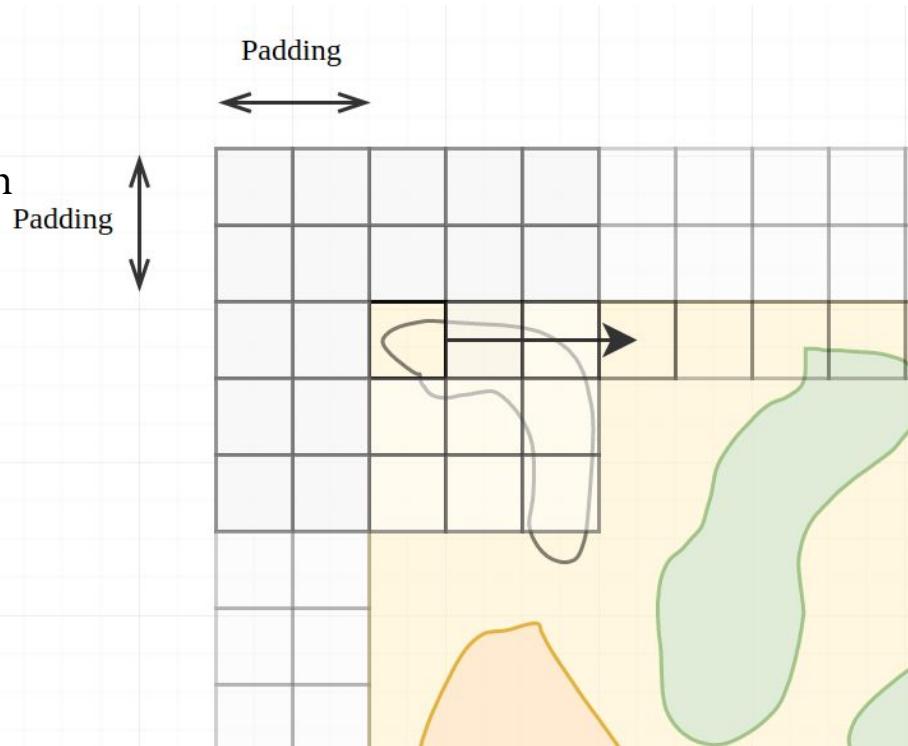

| | Correct Pred. | Incorrect Pred. | Overall Accuracy |

| CNN-7x7 | 187520 | 212480 | 43.94% |

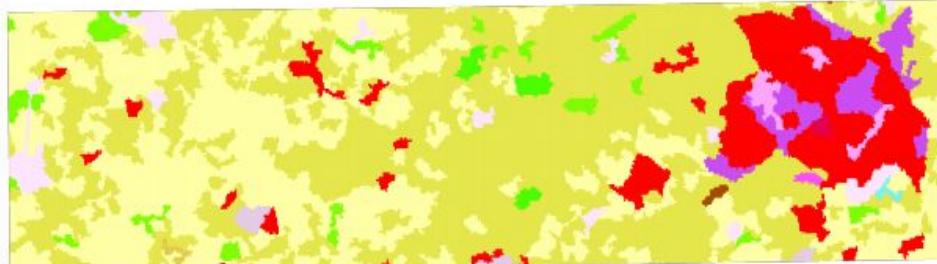

Full AOI Prediction

- Wanted to provide pixel-level predictions over the entire AOI.
- Had to partition into patches.
- Sliding patch-window mechanism.
- Padded the boundaries of the scene with empty pixels.
- Cropped the image, predicted centre pixel, and continue.
- Predicted with CNNs trained on two different patch sizes.

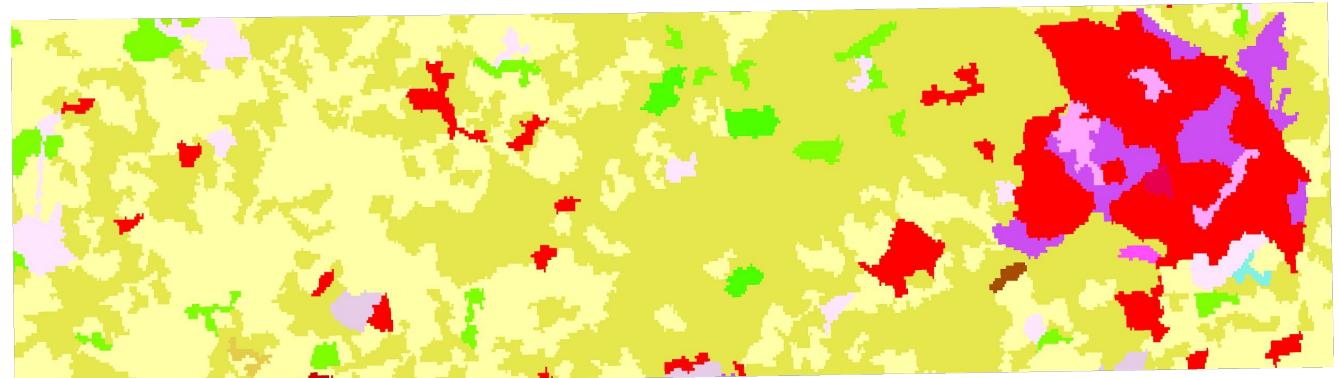

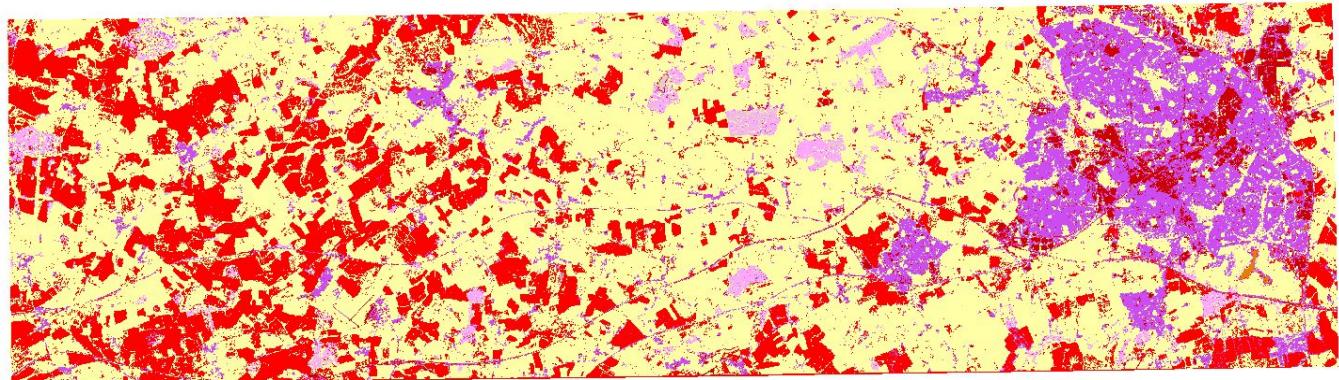

- Continuous urban fabric
- Discontinuous urban fabric
- Industrial or commercial units
- Road and rail networks and associated land
- Airports
- Dump sites
- Construction sites
- Green urban areas
- Sport and leisure facilities
- Non-irrigated arable land
- Pastures
- Land occupied by agriculture and vegetation
- Broad-leaved forest
- Mixed forest
- Transitional woodland-shrub
- Water bodies

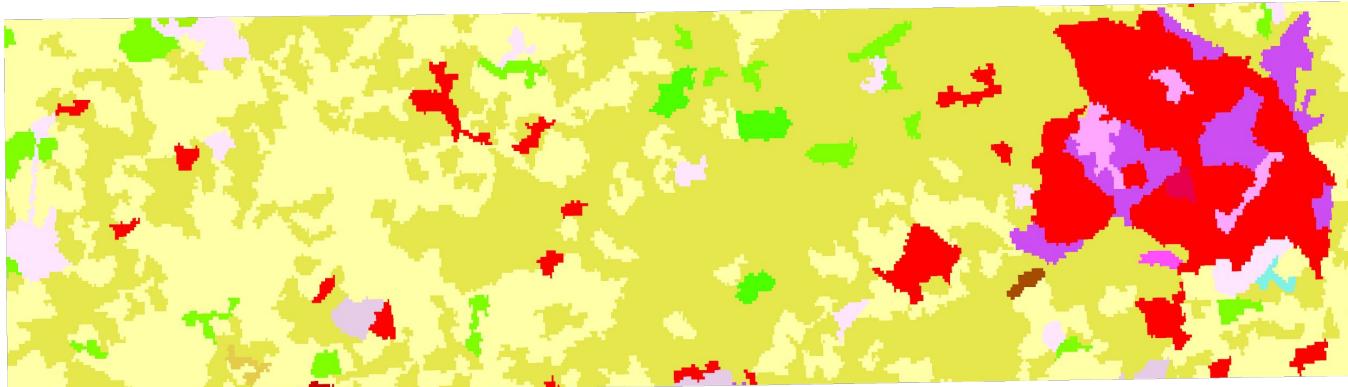

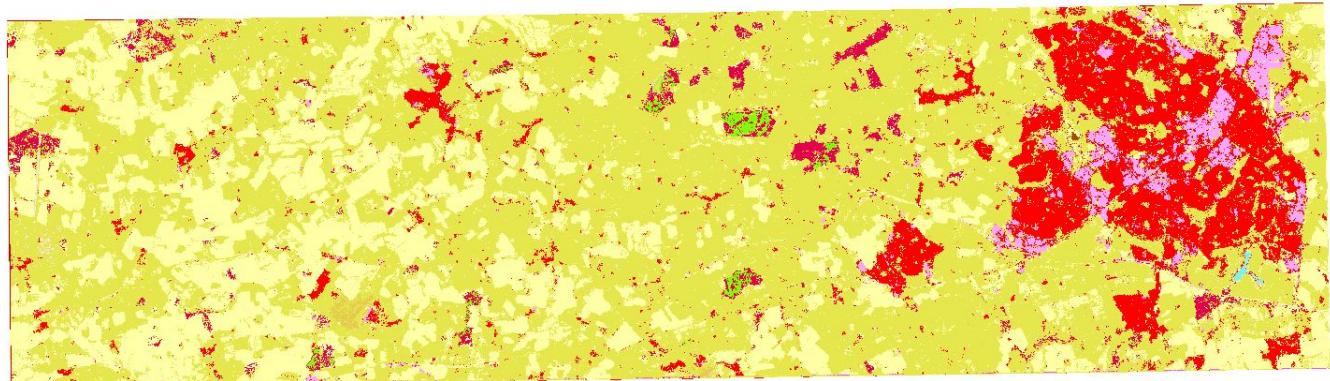

CNN trained on 3x3 patches

- Continuous urban fabric
- Discontinuous urban fabric
- Industrial or commercial units
- Road and rail networks and associated land
- Airports
- Dump sites
- Construction sites
- Green urban areas
- Sport and leisure facilities
- Non-irrigated arable land
- Pastures
- Land occupied by agriculture and vegetation
- Broad-leaved forest
- Mixed forest
- Transitional woodland-shrub
- Water bodies

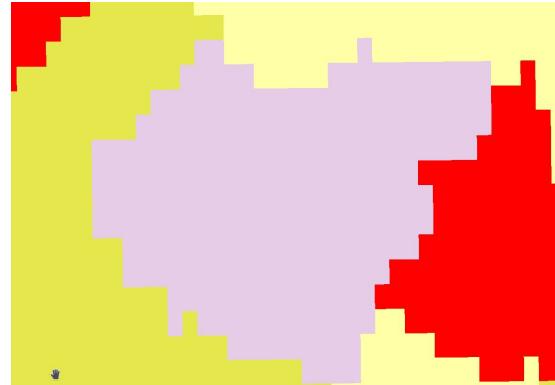

CNN trained on 7x7 patches

- Continuous urban fabric
- Discontinuous urban fabric
- Industrial or commercial units
- Road and rail networks and associated land
- Airports
- Dump sites
- Construction sites
- Green urban areas
- Sport and leisure facilities
- Non-irrigated arable land
- Pastures
- Land occupied by agriculture and vegetation
- Broad-leaved forest
- Mixed forest
- Transitional woodland-shrub
- Water bodies

Transfer Learning Approach

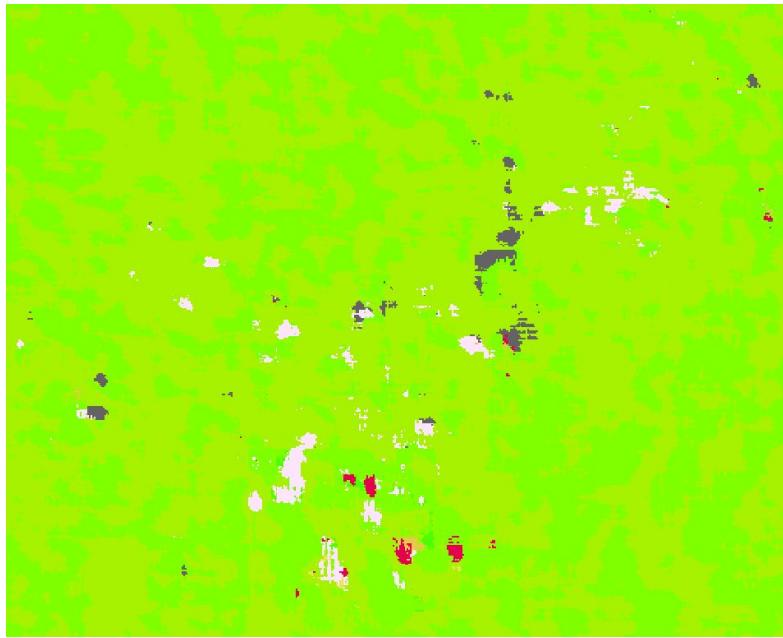

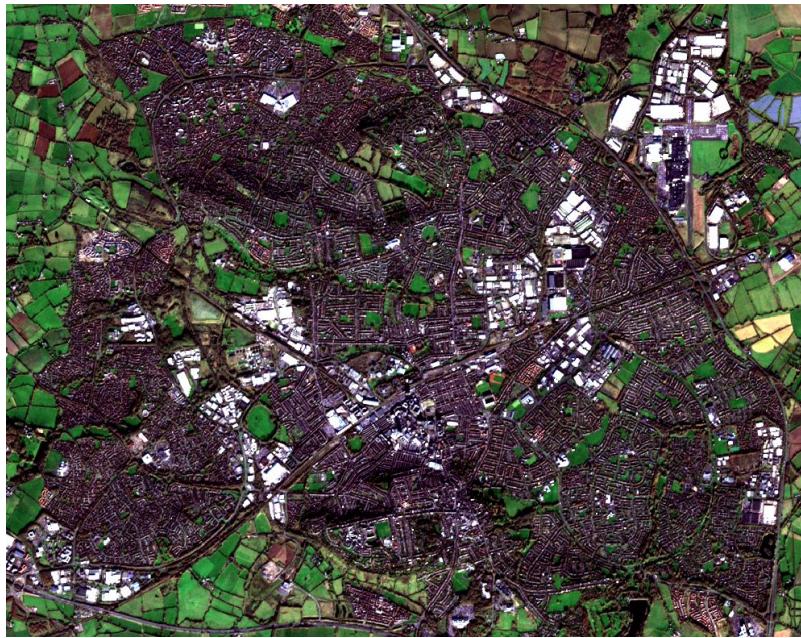

- BigEarthNet: largest archive of high-res Sentinel-2 imagery available.
- Images in the form of 120x120 patches.
- Trained on subset of the overall dataset.
- Used a similar CNN model.

Performance

- Had to severely cut down the dataset to fit our project constraints.
- Struggled to achieve >33% validation accuracy.
- Scene-wide predictions:

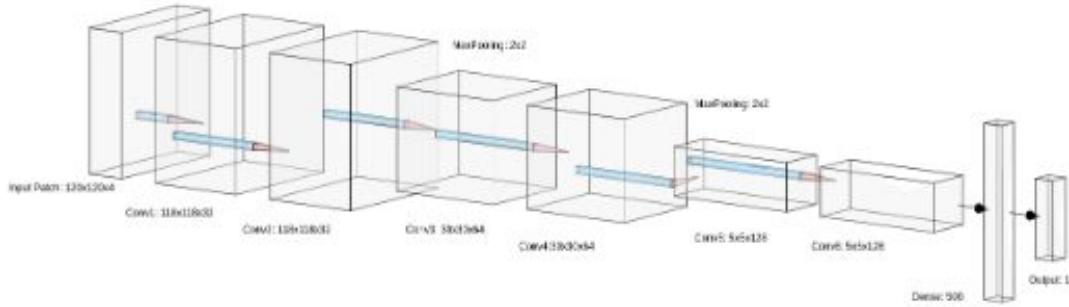

Analysis

- Excellent shape detection using patches.
- Patch-size important predictor.
- Smaller the patch better at detecting finer details, larger patch better at getting actual class.
- Limits to patch size.
- Promising potential.

Future Work

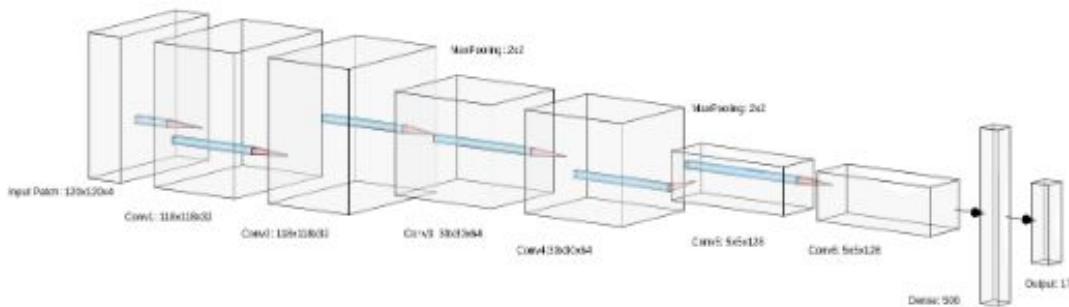

- Further explore Transfer Learning
 - BigEarth + SEN12MS = > 1 million Sentinel-2 patches
 - Train one model on multiple datasets:

BigEarth

Full Model Training

SEN12MS

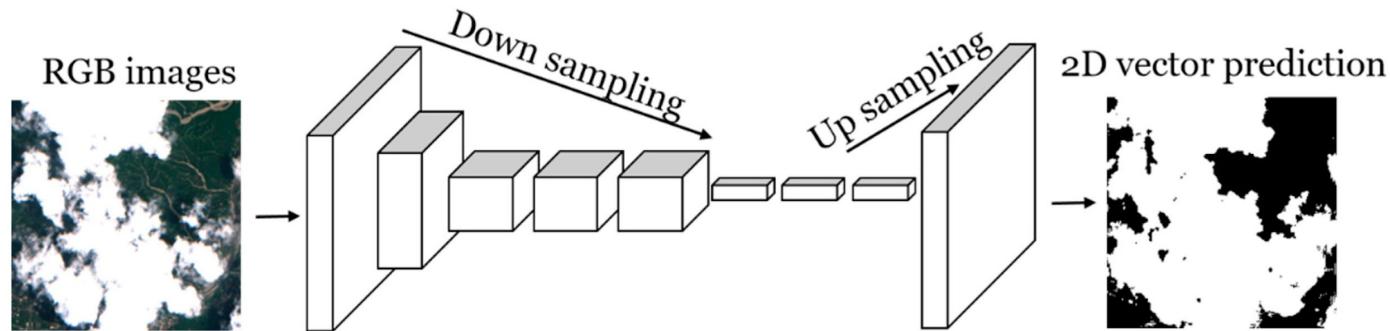

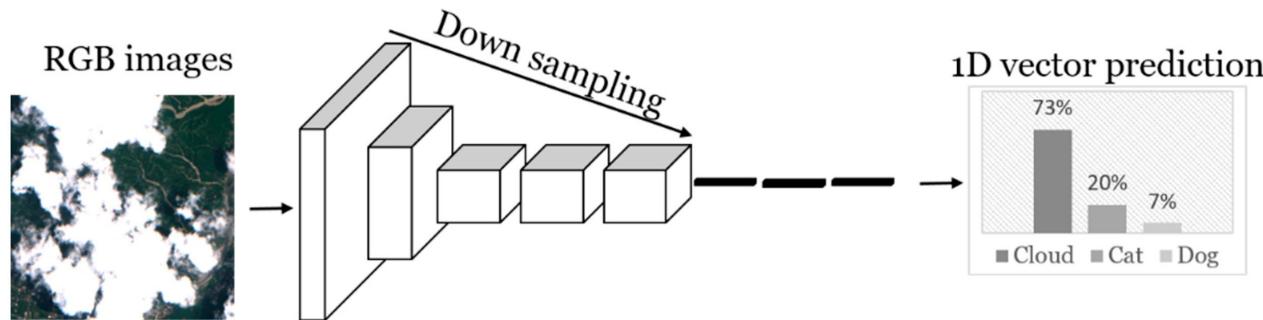

Layers Untrainable

Final Layers Trainable

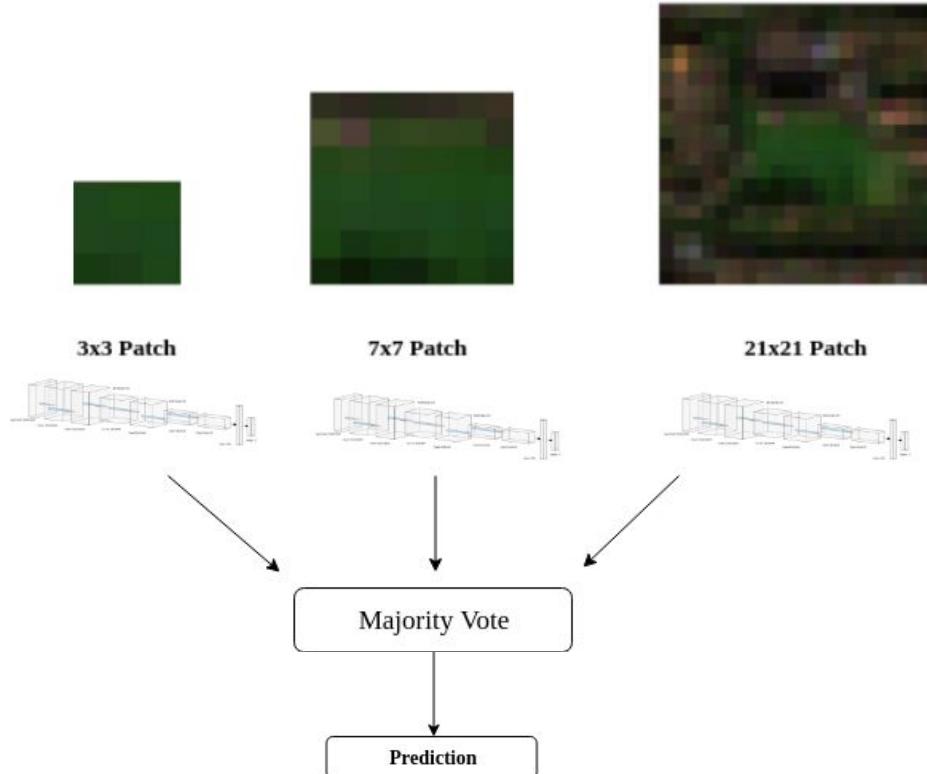

- Semantic Segmentation

- Shrink patch, predict, resize it back to original dimensions
- Output segmented heatmap with pixel-wise predictions:

- Ensemble Learning:

- Run multiple models in parallel.
- Combine the range of information from different patch sizes:

Conclusion

- Considering local image regions can have a positive impact on accuracy.
- Pick up shapes and details overlooked by CORINE.
- The size and content of these regions are critical.
- Combining these techniques with the use of outside datasets and model ensembles.

Thanks for listening! Any questions?
